The Single And Dual Compressor Vertical Air Discharge Condensing Units Features The Floating Tube™ Coil Design

Expanded (Locked) Auxiliary Tubes:

These tubes support the coil with fins and refrigerant carrying tubes. They do not carry refrigerant and are tightly fitted on end supports and center supports.

Free Floating Circuited Coil Tubes:

These tubes carry refrigerant and never touch and sheet metal (end supports and center supports).

All LDV, LDD units include a limited
Five-Year Warranty
against condenser leaks at tube
sheets and center supports.

All condensers use the Floating Tube™ Coil Design to eliminate refrigerant leaks at the tube sheets. Additional tubes are added to the condenser coil. These tubes are expanded into the aluminum fins and condenser tube sheets. These anchor tubes support the weight of the coil, but are not a part of the refrigerant circuit.

The tubes in the refrigerant circuit are expanded into the fins, but “float” through oversized holes in the tube sheets. Tube sheet leaks are virtually eliminated, since the tubes which carry refrigerant never come in contact with the tube sheet.

Beacon II™ Refrigeration System is a patented pre-assembled, factory installed refrigeration system featuring an integrated microcomputer-based electronic control board. Beacon II™ offers:

- Complete factory installation, wiring and testing which saves time and money
- Simplified field electrical connections and 24 volt wiring between condensing and evaporator coil
- Preset factory superheat allowing the system to run more efficiently and reducing future adjustments
- Monitors and controls box temperature, evaporator superheat, system status and defrost
- Monitor and make system changes remotely via modem and exclusive Beacon II™ Smart II software with Smart Controller
- Data logging capabilities with Smart Controller

Beacon II™ Smart Controller

is an optional system monitoring and programming control device. It allows for adjustments to be made at the push of a button from a conveniently mounted location. Beacon II™ Smart Controller also allows you to monitor and make changes to the refrigeration system via modem connection from anywhere in the world. One Smart Controller can program and control up to four condensing units with up to four evaporators on each system. That's more control in your hands!

The patented **Beacon II™ Smart Defrost** system, available with Smart Controllers is uniquely designed to predict frost accumulation and initiates defrosts only when they are needed. It also initiates defrosts to react to operation anomalies, like product deliveries and product pull-down. Typical electric defrost systems have 4 defrosts per day. Using the Smart Defrost system can reduce the number of defrosts to 0, 1, or 2 per day. That's a 75% reduction on average. This greatly reduces the amount of energy used and in turn reduces operating costs.

Beacon II™ Smart II Software makes it easy to adjust and monitor one or more refrigeration systems as well as capture minute by minute system conditions. This Windows-based software allows you to connect to the Beacon II™ Smart Controller from anywhere in the world to monitor the systems, make adjustments and log minute by minute system conditions. This data logging capability is critical in the food service industry.

The Need For Head Pressure Control

Refrigeration condensing units must efficiently perform at varying ambient conditions. A properly sized unit will adequately perform at even the highest summer ambient temperatures. However, in situations where the system must operate the majority of the time at less than design temperature, a means of providing adequate head pressure for refrigerant flow is desirable. The LDV & LDD units have an adjustable Resource II method of head pressure control.

Resource II is Larkin's most energy efficient low ambient head pressure control. This system provides year round control of refrigerant head pressure without the use of special refrigerant expansion valves.

Resource II combines the benefits of refrigerant subcooling and reduced discharged pressure during mild ambient conditions. As the ambient temperature falls, the receiver pressure is allowed to fall to a minimum of 75°F saturated condensing pressure. The reduced discharge pressure at the compressor increases the compressor capacity and lowers the input watts from the compressor motor. Resource II also uses the reduced ambient temperature to subcool the liquid refrigerant in the condenser. This subcooled liquid also increases system capacity. As a general rule, every one degree of subcooling results in a 0.50% increase in system capacity. Together these result in greater efficiency, greater capacity, and reduced run time.

Benefits

- Automatic year-round control of refrigerant head pressure without the use of special expansion valves
- Energy savings in mild ambient conditions due to reduced compressor discharge pressure and refrigerant subcooling
- Provides easy restart during low ambient conditions

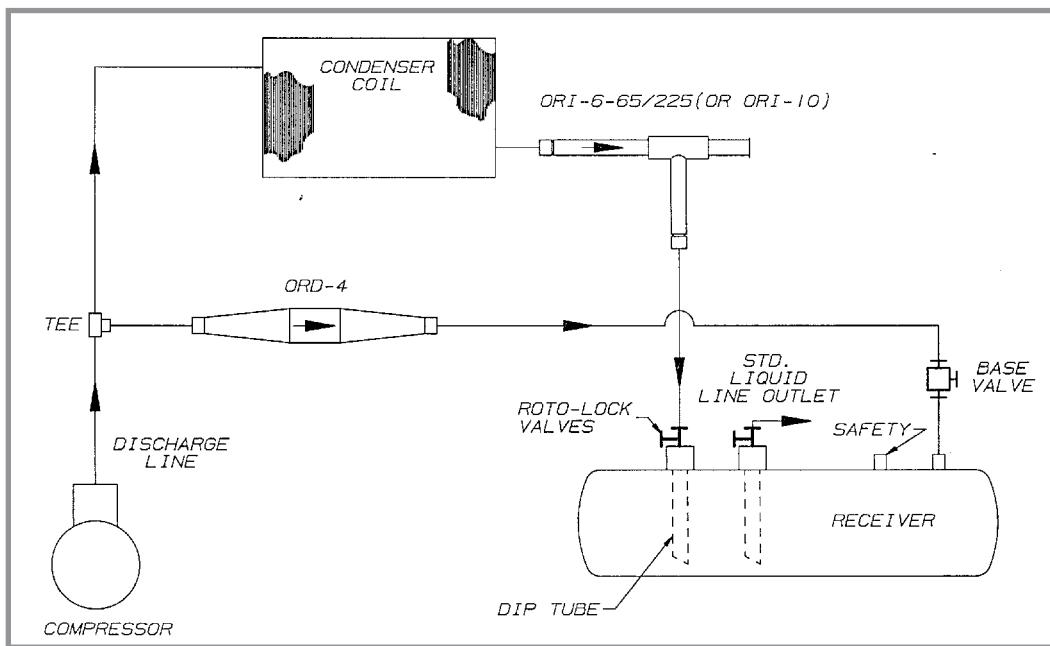

Operation

As the ambient temperature falls, the system condensing pressure is also reduced. This pressure is maintained by a regulator (ORI-6-65/225) at the condenser drain. At approximately 75°F saturated condensing pressure the regulator restricts the flow of liquid refrigerant from the condenser causing the condenser to flood. This condenser flooding allows the liquid refrigerant in the condenser to become subcooled by the ambient air flowing through the condenser. As the regulator continues to flood the condenser, a pressure differential will be established between the receiver and the compressor discharge. At a predetermined differential, a second valve (ORD-4) will open and allow discharge gas from the compressor to bypass the condenser and flow into the top of the receiver. This gas is used to pressurize the receiver.

Both the inlet and outlet tubes of the receiver have dip tubes which are immersed in liquid refrigerant. The liquid in the receiver acts as an insulator from the vapor area of the receiver. This unique design minimizes the contact of the hot gas used to pressurize the receiver through the ORD-4 valve. This allows bypass vapor to pressurize the receiver while reheat of the subcooled liquid is minimized.

Subcooled liquid is further enhanced by the routing of liquid from the receiver liquid line outlet to the condenser before leaving the condensing unit.

Single Vertical Air Discharge Condensing Unit

The LDV series utilizes the base air cooled condenser design in the RC6/RC8 series of condensers. By borrowing the design of the thoroughly tested, Floating Tube™ coil design condensers a great deal of design integrity is immediately incorporated into this series of units. The product is designed not only to give outstanding operational performance with today's HFC and HCFC refrigerants, but it is also designed to be easily transported and rigged into position. And most importantly, the LDV is designed utilizing input from service contractors, the result being a product which can be installed and maintained without many of the hassles involved in older product designs.

The design utilizes many features which are incorporated to provide a reliable product.

- All common serviceable controls (pressure controls/time clocks etc.) are located in a separate electrical compartment from the main electrical box. This allows ease of service without disconnecting power to the unit
- A generous amount of clearance has been designed under the condenser section of the unit. Coil cleaning and component service are made easy
- 3/8 inch condenser coils (except 3501 & 4001) provide efficient performance with minimal pressure drop and refrigerant charge
- The LDV series of units is configured such that a minimal number of standard components are pre-configured into the base design. This allows for customization of a particular unit to suit the needs of the application
- LDV models are also available with oversized condensers. These units provide increased efficiency with lowered head pressures and condensing temperatures
- The Floating Tube™ coil design. Refrigerant-carrying copper tubes do not contact any metal support tubes; instead, the coil is constructed with expanded anchor tubes that support the coil construction and do not carry refrigerant. The coil design eliminates one of the major causes of leaks in refrigeration systems
- All sweat type connections, no flare joints to leak
- Fixed high pressure switch eliminates capillary tube
- Designed for use with R-404A, R-507, or R-22
- Polyol ester oil charge on all units
- Pre-Bent copper tubes minimize welded joints on internal piping
- Sentronic™ oil safety control

Standard Features

- High efficiency Copeland Discus® compressors with POE oil
- Thermally protected, permanently lubricated ball bearing condenser fan motor(s)
- Separate subcooling circuit in condenser for added capacity and vapor-free liquid
- Receivers are sized for sufficient pumpdown capacity with inlet and outlet service valves
- Sealed liquid line filter drier and sight glass
- Electrical controls, including compressor contactor and optional defrost control, are located in easily accessible control box with a hinged cover
- Service Mate™ module to assist troubleshooting
- Cabinet is constructed from prepainted galvanized steel
- Convenient access panels for easy servicing to internal components
- Suction and discharge vibration eliminators
- Resource II head pressure control

Factory-Installed Optional Features

- Replaceable core liquid filter drier
- Liquid line solenoid valve
- Suction filter
- Replaceable core suction filter
- Suction accumulator
- Oil separator with discharge line check valve
- Air defrost timer
- Electric defrost kits, including timer, evaporative fan controller with fusing, defrost heater contactor(s), lockout relay and terminal strip
- Fused disconnect switch
- Non-fused disconnect switch
- Demand cooling for low temperature R-22
- Coated condenser coils for protection against corrosion in harsh environments
- Insulated receiver low ambient kit
- Beacon II™ compatible

MOP = Maximum Overcurrent Protection

Beacon II™ and Air Defrost Units do not carry any of the evaporator fan or heater loads.

Power is brought directly to the evaporators and does not go through the condensing unit.

Mounted Electric Defrost Kits for LDV condensing units include:

Defrost timer, terminal strip, (1) evaporator fan contactor and:

One (1) defrost heater contactor for 1L and 1H codes

Two (2) defrost heater contactors for 2L and 2H codes

Four (4) defrost heater contactors for 4L and 4H codes

An evaporator heater hold out relay (option) is recommended when two or more evaporators are connected to a single (LDV/ LDD) condensing unit to allow termination on coils that have already defrosted to prevent unnecessary steaming.

This option is not needed on Beacon II™ (LDVS) systems wired for a Master / Slave operation. Power is brought to each Beacon evaporator.

Each coil terminates its own defrost. Refrigeration will not start until all coils have terminated defrost.

Contact factory for 575 volt electrical specification.

Dual Vertical Air Discharge Condensing Unit

The LDD Series of dual compressor outdoor condensing units are designed for use in commercial refrigerated warehouse and light industrial applications. The units utilize the Floating Tube™ coil design air-cooled condenser design (RC8 series) and offer a premium warranty against tube sheet and center leaks. The LDD consists of two independent refrigeration circuits in a

single housing which can reduce space requirements and installation and rigging costs. Standard models are available in even horsepower configurations from 24 to 80 horsepower; however, unequal horsepower and other customer features can be designed to suit the application.

Design Features

- Resource II is Larkin's most energy efficient low ambient head pressure control. This system provides year round control of refrigerant head pressure without the use of special refrigerant expansion valves.
- A generous amount of clearance under the condenser section of the unit has been provided to allow ease of service to the coil section and liquid and suction filters.
- A minimal number of standard accessories have been pre-configured into the base design of the unit. Customization of the product is made easily.
- All common serviceable controls are located in a separate electrical compartment from the main electrical box. Service is made easy without disconnecting power to the unit.

**The electrical box is divided into two compartments.
All serviceable controls are accessible without disconnecting power to the unit.**

Standard Features

- High efficiency Copeland Discus® compressors with POE oil
- Thermally protected permanently lubricated ball bearing condenser fan motors
- Electrical controls, including compressor contactor and optional defrost control, are located in easily accessible control box with a hinged cover
- Resource II head pressure control system
- Receivers are sized for sufficient pumpdown capacity with inlet and outlet service valves
- Cabinet is constructed from prepainted galvanized steel
- Convenient access panels for easy servicing to internal components
- Suction and discharge vibration eliminators
- Separate subcooling circuit in condensers for added capacity and vapor-free liquid
- Sealed liquid line filter drier and sight glass
- Service Mate™ module to assist troubleshooting

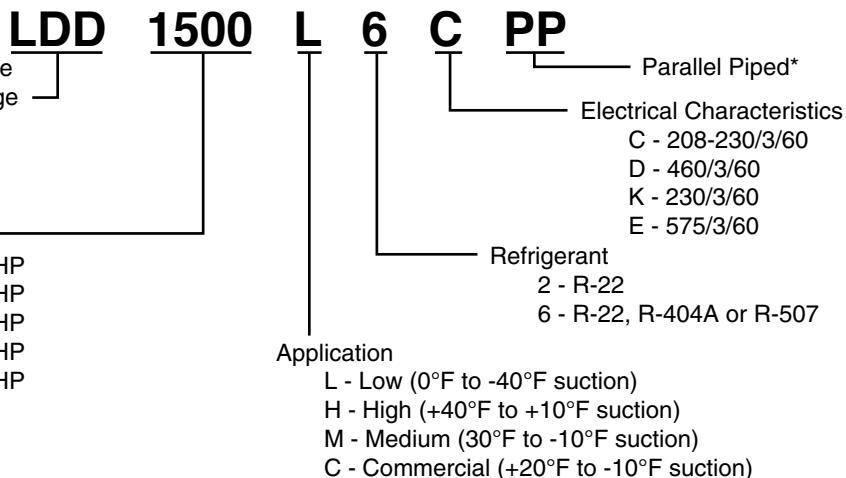

Additional Standard Features for Parallel Piped Units

- Replaceable liquid suction filter
- Replaceable core suction filter
- Suction accumulator
- Oil management system

Factory-Installed Optional Features

- Liquid line solenoid valves
- Suction filters
- Replaceable core liquid filter driers
- Suction accumulators
- Oil separators
- Air defrost timers
- Electric defrost kits, including timer, evaporative fan controller with fusing, defrost heater contactor(s), lockout relay and terminal strip
- Low ambient kit with heated and insulated receiver with time delay
- Compressor loading
- External discharge line muffler
- Phase-loss protection
- Manual-reset high pressure switches
- Compressor circuit breakers
- Condenser fan cycling
- Demand cooling for low temperature R-22
- Three-way heat reclaim valve
- Coated condenser coils for protection against corrosion in harsh environment
- Beacon II™ compatible
- System piped for parallel operation with oil equalization system

Nomenclature

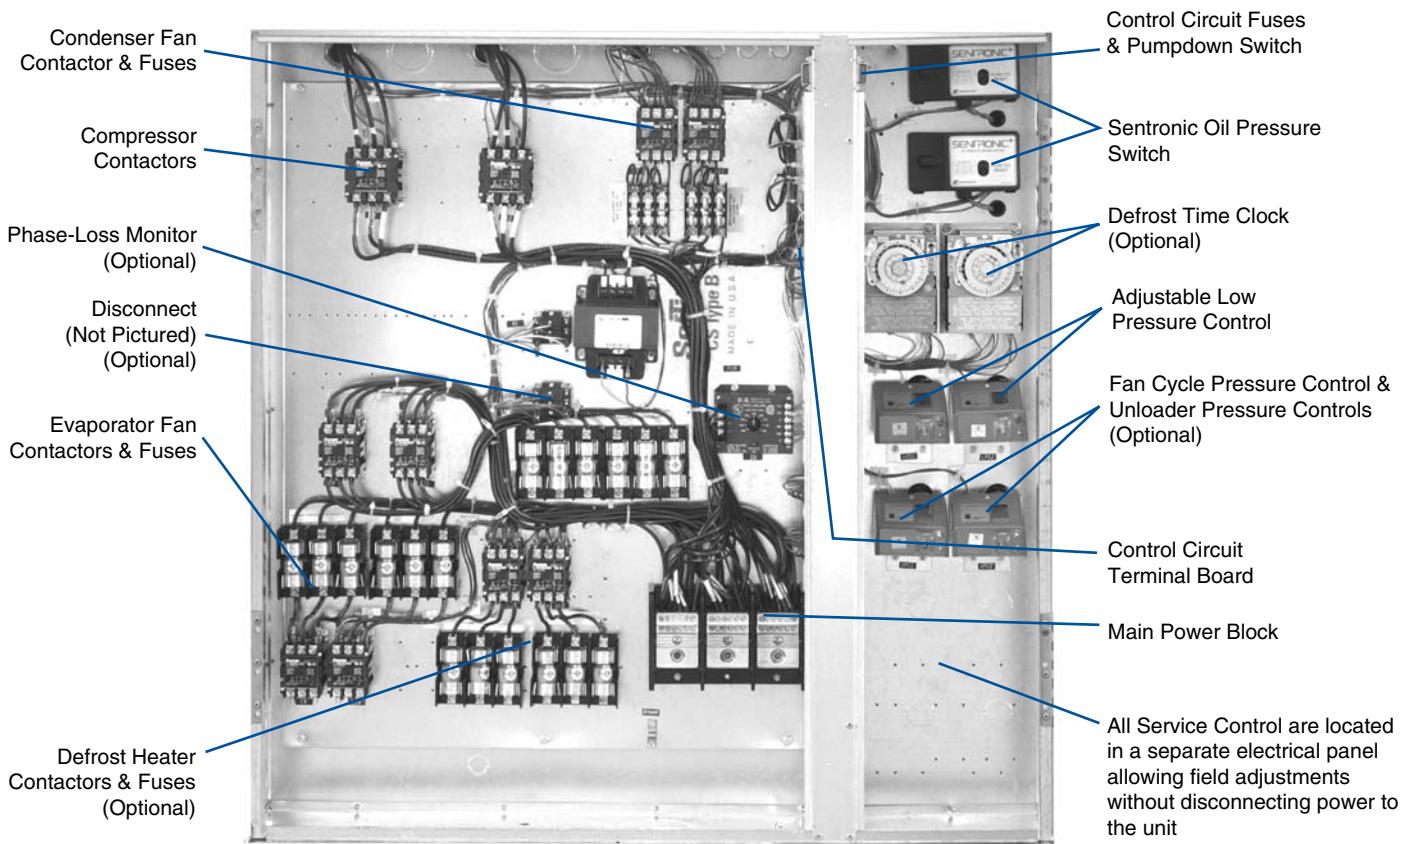

*Not available with Beacon II™ System
